

ABSTRACT OF THE DISCLOSURE

A valve arrangement is arranged in a fluid passage of a nozzle body of a washer nozzle. The valve arrangement permits forward flow of the washer fluid in a first direction from an inlet opening of the nozzle body toward discharge openings of the nozzle body and blocks backflow of the washer fluid in a second direction opposite from the first direction. A filter is arranged in the fluid passage of the nozzle body between the inlet opening and the valve arrangement to filter the washer fluid.
